Summary

Full-stack and mobile software engineer (BSc Software Engineering) who builds products that handle payments, real users and real failure modes. Building production software since 2023, including a campus marketplace in production with real users and a Paystack payments layer, an events and ticketing platform, and a crowdsourced network-quality app. Strongest in payments integration, server-enforced trust, offline-first mobile and realtime systems. Co-founder of Trybenode and founder of Primsett.

Experience

Co-Founder & Software Engineer, Trybenode · 2025 – Present

Student-founded software company built around a community of students, tech enthusiasts and entrepreneurs (trybenode.online).

- Build and operate the company's products: TrybeMarket, a campus marketplace live in production, and TrybeTickets, an events platform that handles ticket sales.
- Deliver client web projects, including domain, hosting and email setup (Zoho Mail, Google Workspace), with structured client quotes.
- Own engineering across web, mobile and backend, from architecture through deployment.

Founder, Primsett · 2026 · In development

Beauty booking platform for Lagos nail technicians, lash technicians, makeup artists and hair stylists.

- Ran user interviews with beauty professionals and designed the business model (freemium SaaS plus a transaction fee).
- Designed the database schema and chose the stack: Next.js, Fastify, Drizzle ORM, PostgreSQL/Supabase, Redis, BullMQ, Clerk and Paystack.
- Reversed the escrow payment design mid-project in favour of immediate vendor payout with reputation-based trust.

Mobile Developer (Internship), Stardelite LTD · Remote, Lagos · March 2025 – September 2025

- Developed mobile app features in React Native and JavaScript as a remote intern.
- Tested and debugged API integrations with Postman.
- Worked on Goal paddy, an **AI Goal coaching, tracking, accountability, team goals app built with ReactNative, Next.js, Tailwind CSS, AWS, NestJS, and OpenAI API.**
- Also Worked on the revamp of WinMatch247, a p2p betting platform.

Freelance Web Developer · 2023 - Present

- Built Harbor Foundation, a multi-page nonprofit donation platform, and a cinematic fan-experience landing page for clients.
- Scoped and proposed a Nigerian crypto exchange platform (dealer model, Paystack and Quidax) for a client.

Selected Projects

TrybeMarket · Campus marketplace · In production · GitHub

Next.js 15, React, Firebase Auth, Firestore and Admin SDK, Paystack, Tailwind, shadcn/ui, Google Cloud Vision, Vercel. About 27k lines, 37 API routes and 444 commits; 237 users and 75 listings at last count.

- Designed a reserve, commit and void credit-spend flow using Firestore transactions and HMAC-SHA512-verified Paystack webhooks, with idempotent document IDs and a kill switch. Concurrency tests confirmed balances never go negative.
- Audited a client-writable Firestore backend and closed privilege-escalation paths (free boosts, self-assigned seller tiers, spoofed verification) with security rules and Admin-SDK-only writes.
- Built tier-safe listing ranking with a cron-rotated tiebreaker that re-saving a listing cannot game, plus a transaction history that merges four collections into one row per purchase.

CribNConnect · Apartments, events and social linkups · In active development · GitHub: mobile

Expo SDK 57, React Native, Expo Router, Firebase Auth and Firestore, Paystack, Zustand, NativeWind. About 48.8k lines across 194 files, 542 commits since July 2025 and roughly 77 API endpoints consumed.

- Built an offline-first QR ticket scanner: a capped, expiring duplicate-detection cache, a queue that syncs offline scans later, and manager and validator staff roles.
- Solved a post-payment DNS failure in a Paystack WebView checkout by intercepting navigation and verifying the payment server-side, with a guard against double verification. Supports USSD, bank transfer and mobile money.
- Implemented realtime Firestore chat across linkup groups, event chats and direct messages, with unread tracking and admin roles, plus a persistent multi-step hosting wizard with server-synced drafts.

Network Analyser · Crowdsourced network-quality monitor for Nigeria · In active development · Github: Network Analyser

React Native (Expo SDK 54), Node.js, Express 5, MongoDB Atlas, Redis, React 19 with Vite for the dashboard. Three apps in one repo, about 7,500 lines and 129 commits.

- Detects outages that speed-test apps miss: a failed health-check ping flags a dead connection even when the OS reports it as connected, and unsent samples queue offline.
- Applied DBSCAN clustering with a Haversine metric to find dead zones per carrier, backed by 2dsphere and geohash indexes and median-based aggregation to resist bad data.
- Built battery-aware adaptive sampling on the device and Redis cache-aside on the API that keeps working if Redis goes down.

Technical Skills

Area	Tools
Languages	JavaScript, TypeScript, Python, HTML, CSS
Frontend	React, Next.js, Tailwind CSS, Framer Motion, shadcn/ui, Vite, Zustand
Mobile	React Native, Expo, Expo Router, NativeWind, Reanimated, react-native-maps
Backend and data	Node.js, Express, Firebase (Auth, Firestore, Admin SDK, security rules), MongoDB, Redis, PostgreSQL, Django, REST API design

Area	Tools
Payments and integrations	Paystack (popup, WebView, webhooks), Google Cloud Vision, Resend and Nodemailer
Practices	Server-side validation, idempotency, offline-first design, realtime sync, geospatial clustering, Git and GitHub, Vercel, AI-assisted development with Claude Code

Education & Certifications

- **BSc Software Engineering**, Lead City University, Ibadan, Nigeria · 2026
- **CS50x: Introduction to Computer Science**, Harvard (HarvardX / edX) · 2023
- **Front End Development certification**, freeCodeCamp · 2024

Competitions

Ecobank InnovateX 2026, Regional Stage. Team shortlisted and advanced with "Dynamic Trust Infrastructure for Africa's Informal Economy", a modular trust API layered on identity verification. Responsible for frontend implementation, rapid prototyping and API integration (Next.js, React, Tailwind) against a FastAPI backend.
